

CT DOT: Process and Procedure Changes for Documenting Storm Water Quality Improvements

CTDOT Designer Training

Conference Room A

10 am, May 6, 2019

Agenda

- **CTDOT MS4 Team & MS4 Background**
- DOT MS4 Permit Overview
- Design Implementation
- Impaired Waters & USGS Water Quality Model

CTDOT MS4 Team

Bureau of Engineering and Construction
Office of Engineering
Environmental Compliance

Adam Fox P.E.
Transportation Principal Engineer

Jason Coite P.E.

Daniel Imig P.E.

Bureau of Policy and Planning
Office of Environmental Planning

Kim Lesay
Assistant Planning Director

Kevin Carifa

Jeremy Willcox

MS4 Team Email: DOT.MS4@ct.gov

MS4 Basics

MS4

- **Municipal Separate Storm Sewer System**
 - a publicly owned stormwater runoff conveyance system
 - discharges to the waters of the U.S.

NPDES

- **National Pollutant Discharge Elimination System**
 - Permits Issued by Authorized States or EPA

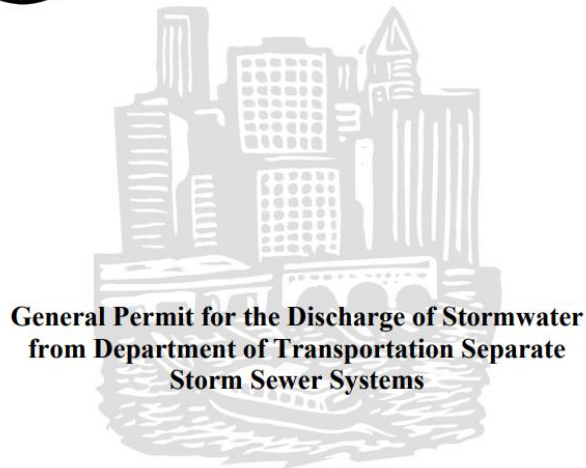

MS4 Basics

DOT MS4 Permit Development

Connecticut Department of
Energy & Environmental Protection
Bureau of Materials Management & Compliance Assurance
Water Permitting & Enforcement Division

**General Permit for the Discharge of Stormwater
from Department of Transportation Separate
Storm Sewer Systems**

Issued: May 24, 2018

Effective: July 1, 2019

- CTDOT is considered as a non-traditional municipality
- The DOT MS4 permit
 - based on the Small MS4 General Permit
 - a General Permit for one permittee

DOT MS4 Permit Development

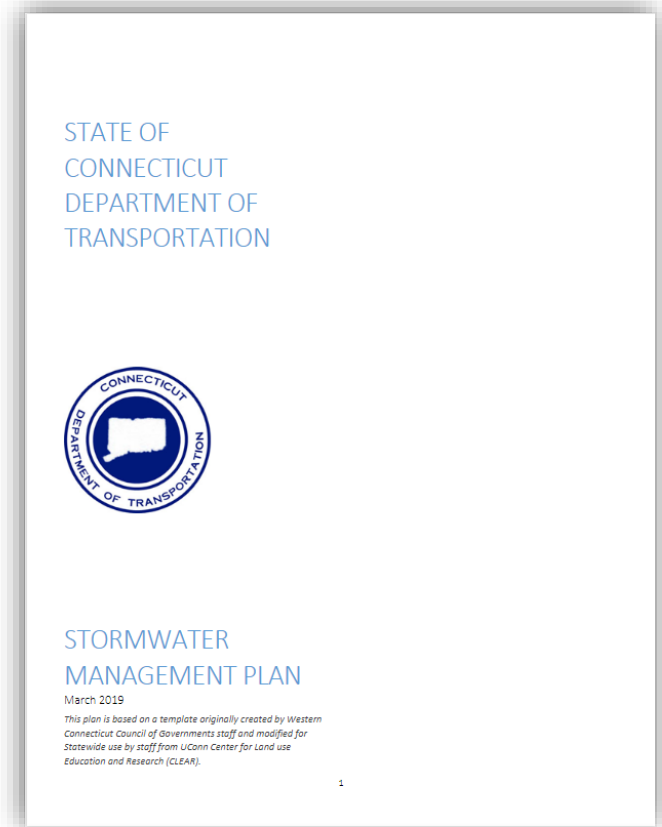

- 14 Sessions Over 18 Months
- Key Mediation Wins

Subject	Original Permit Language	Revised Language
Permit Effective Date	7/1/2018	7/1/2019
Permit Effective Area	Entire State	Municipal MS4 Areas
Mapping	100% - Year 5	50% - Year 5 100% - Year 10
Impaired Waters Screening & Sampling	40% - Year 5 100% - Year 10	Utilize USGS Model for Majority
Impaired Waters Screening & Sampling (Bacteria)	Every Outfall	Representative Outfalls / Scuppers
Mitigation Projects	Within or Outside of DOT ROW (Property Acquisition)	Only Within DOT ROW

DOT's Stormwater Management Plan

- Plan can be found here:
<https://www.ct.gov/dot/CTDOT-MS4>
- Comments on the plan can be sent to:
DOT.MS4@ct.gov
- Comment Period Ends
June 30, 2019

Agenda

- CTDOT MS4 Team & MS4 Background
- DOT MS4 Permit Overview
- Design Implementation
- Impaired Waters & USGS Water Quality Model

DOT Permit Overview

- Six Minimum Control Measures (MCMs)
 1. Public Outreach & Education
 2. Public Involvement / Participation
 3. Illicit Discharge Detection & Elimination
 4. Construction Site Stormwater Runoff Control
 5. **Post Construction Stormwater Management**
 6. Pollution Prevention / Good Housekeeping
- Outfall Monitoring Requirements

DOT Permit Overview

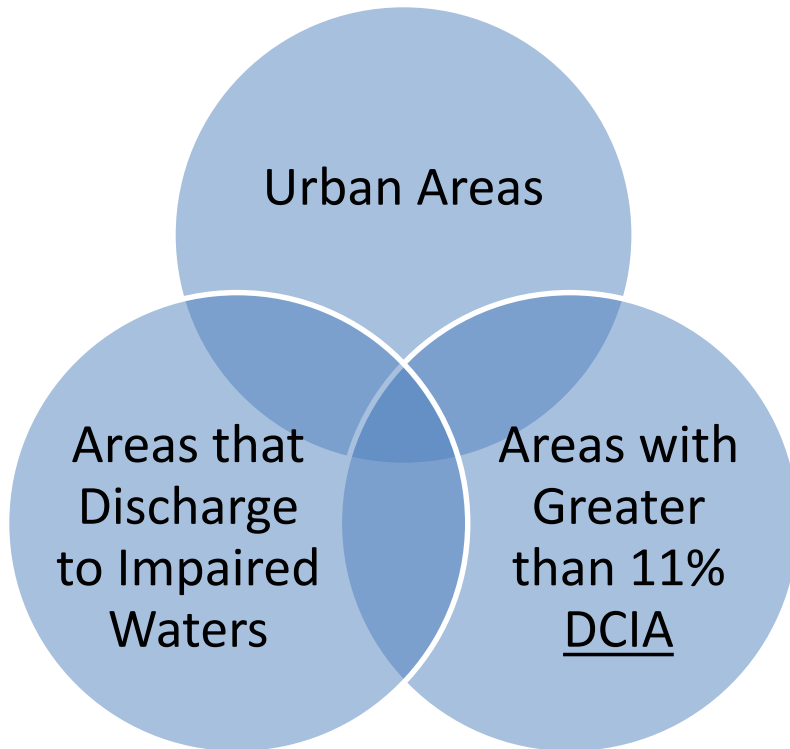

Maximum Extent Practicable (MEP)

- There must be a serious attempt to comply, and practical solutions may not be lightly rejected
- Factors in determining MEP include
 - Site Constraints
 - Ability to finance
 - Schedule

DOT MS4 Permit Overview

MS4 Priority Areas

Directly Conected Impervious Area

Retrieved from UCONN NEMO "What Type of Impervious Cover do you Have?"
<https://nemo.uconn.edu/ic-guide/step2-type.htm>

Disconnected DCIA

Retrieved from UCONN NEMO "What Type of Impervious Cover do you Have?"
<https://nemo.uconn.edu/ic-guide/step2-type.htm>

DOT Permit Overview

Priority Area Information on the Revised PNDP

- Priority area information on the PNDP to be filled out by OEP

STORMWATER & MS4 CONSIDERATIONS

NDDB COORDINATION (CONSTRUCTION STORMWATER ONLY***)

PROJECT LOCATED IN PRIORITY AREA*: YES NO

PROJECT IN URBANIZED AREA

IMPERVIOUS COVER OF WATERSHED >11%

IMPAIRED WATERBODY, IF YES TYPE OF IMPAIRMENT: [Click or tap here to enter text.](#)

***IF A CONSTRUCTION STORMWATER PERMIT IS REQUIRED NDDB COORDINATION IS TRIGGERED BY PROJECTS WITHIN 1/4MI OF A MAPPED NDDB AREA

*PRIORITY AREA WILL BE CHECKED 'YES' IF ANY OF THE THREE ITEMS BELOW IS PRESENT WITHIN PROJECT LIMITS. USE THIS INFORMATION TO COMPLETE THE MS4 MEP WORKSHEET

Screenshot of Draft PNDP Section on MS4 Information

Permit Overview

Public Outreach (MCM 1)

- **Educational Handouts** will be developed by the MS4 team and should be made available at public meetings

WATER QUALITY IMPACTS

Due to mercury's high toxicity level, only a small drop of mercury in a lake can contaminate the entire waterbody. Mercury bioaccumulates in fish and humans, meaning levels of mercury in the body can build over time under continued exposure. This magnifies the health effects of mercury, which can be severe, if not fatal.

"POLLUTED STORMWATER RUNOFF IS THE MOST SIGNIFICANT SOURCE OF WATER QUALITY PROBLEMS"

MERCURY AND STORMWATER POLLUTION

CONNECTICUT DEPARTMENT OF TRANSPORTATION

OFFICE OF ENVIRONMENTAL PLANNING

www.ct.gov/dot/CTDOT-MS4

NITROGEN POLLUTION

Nitrogen is a naturally-occurring element which, due to human activities, has become a major concern for water quality.

Common everyday activities have caused nitrogen concentrations in rivers and lakes to reach dangerously high levels. Nitrogen feeds algal blooms, which choke out aquatic life and impact fishing and recreation.

With high levels of nitrogen in the water, fish and other organisms may suffocate under severe conditions.

In Connecticut, all of our major waterbodies and watercourses are affected by nitrogen pollution, with the ultimate discharge point being Long Island Sound.

COMMON NITROGEN SOURCES

- Septic systems
- Fertilizer
- Grass clippings/leaves
- Sediment from construction sites
- Erosion

IMPACT ON LONG ISLAND SOUND

Each summer, nitrogen and phosphorus pollution cause oxygen levels in Long Island Sound to fall so drastically that fish cannot survive in certain areas.

Algal blooms stunt the growth of underwater plants, which provide essential habitats for shellfish and other small organisms.

Despite State and Federal regulations, areas of Long Island Sound continue to be uninhabitable for aquatic life, largely due to Nitrogen pollution in Connecticut.

WHO DOES THIS AFFECT? YOU!

Public Water Supply	Recreation
Fishing/Aquatic Life	Industry

Source: CT DEP

WHAT YOU CAN DO

- Limit lawn fertilizer use
 - o Check the weather forecast before applying fertilizer – do not apply before a rain storm
 - o Use fertilizer only during spring and fall when it can be readily used by plants
 - o Never use fertilizer near waterbodies or watercourses
- Do not overwater your lawn
 - o Overwatering will spread nitrogen and other nutrients
- Compost grass clippings on your property
- Regularly service septic systems
- Reduce automobile use and idling
 - o Nitrogen Oxides (NOx) due to combustion of fossil fuels pollutes the atmosphere and later falls to water sources as acid rain

Be the solution to runoff pollution.

Source: US EPA

Permit Overview

IDDE Mapping Requirements (MCM 3)

- Permit:
 - Half the system must be mapped within 5 years
 - Map the rest within 10 years
- Goal: map 10% of system every year
 - CADD → GIS
 - Digitization of older plans
 - Field mapping/verification

Mapping DOT's Stormwater System

- Starting from scratch
- Mapping Standardization
 - COG's GIS Standards Committee
 - DOT schema will be the basis of the State Standard
- Long-term: Sharing MS4 interconnection data with municipalities

Screenshot of CTDOT GIS Stormwater Map Beta Test

Post-Construction Requirements (MCM 5)

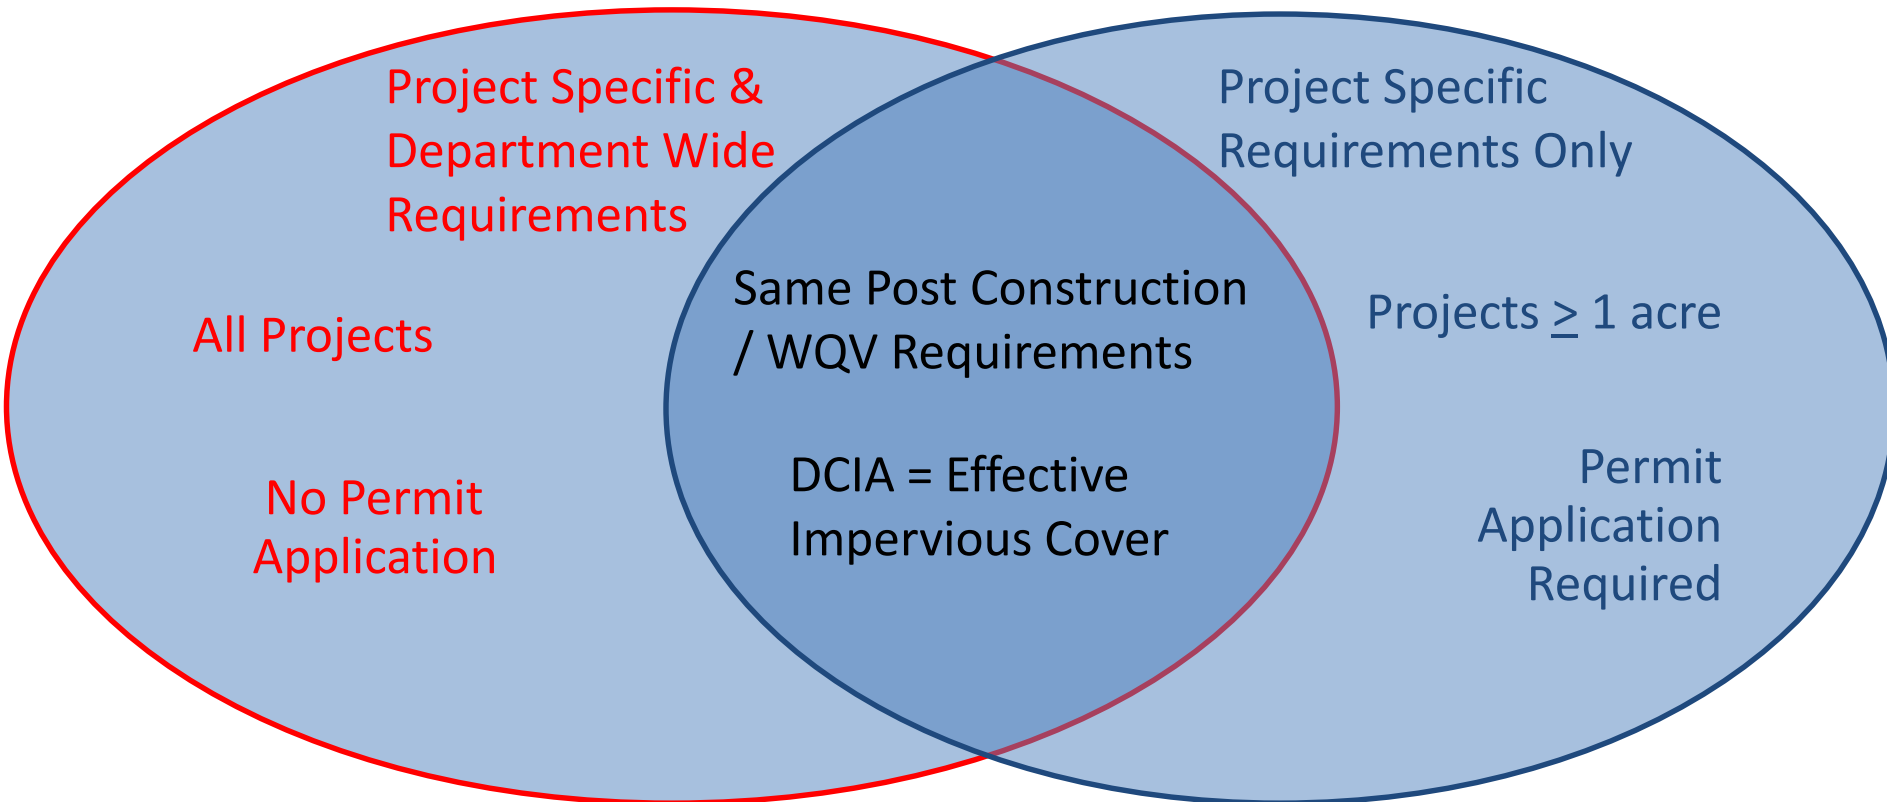

- Same post-construction requirements as construction general permit
 - Project Area \geq 40% Impervious Area → Retain $\frac{1}{2}$ WQV
 - Project Area <40% Impervious Area → Retain Full WQV
- **Applies to all projects**
 - **No 1 acre of disturbance threshold**
- Incorporate concept designs into 30%

MS4 Permit – Construction Permit

MS4 Permit

Construction Stormwater Permit

Permit Overview

Post- Construction Requirements (MCM 5)

DCIA Disconnections

- Disconnect 2% of DCIA by 2024
- DCIA reductions to come from BMPs incorporated into projects
- Must document DCIA on every project
- Annual Reporting Requirement
- Projects that add DCIA will need to be offset by another
- Long-term: Stand alone retrofit projects

Agenda

- CTDOT MS4 Team & MS4 Background
- DOT MS4 Permit Overview
- Design Implementation
- Impaired Waters & USGS Water Quality Model

Design Implementation

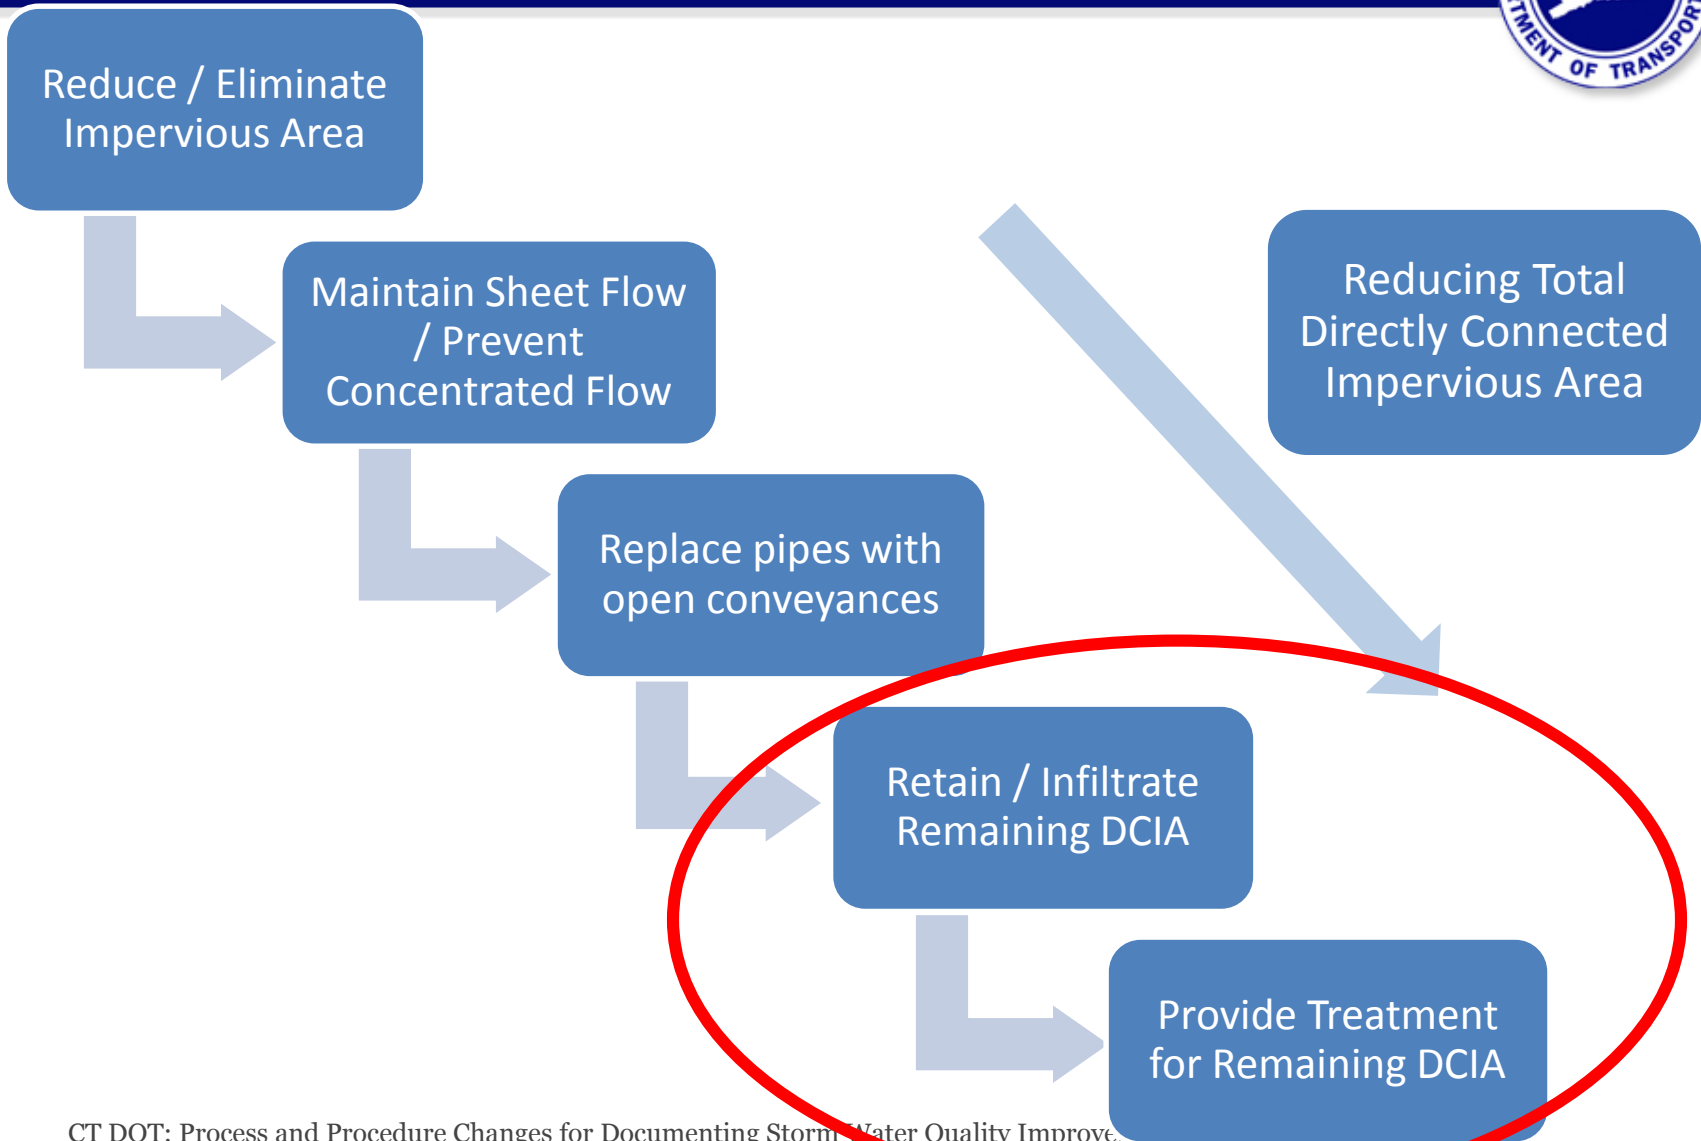

Post- Construction Requirements (MCM 5)

DCIA Disconnections

- Disconnect 2% of DCIA by 2024
 - **Initial DCIA reductions to come from currently planned projects**
- Must document DCIA on every project
- Annual Reporting Requirement
- Projects that add DCIA will need to be offset by another
- Long-term: Stand alone retrofit projects

Design Process – Reducing DCIA

DCIA DISCONNECTIONS

- Disconnections to be achieved through Stormwater BMPs on a project level

DISCONNECTED = the *WQV Retention*

Goal is retained

= the *WQV Retention goal* is treated if it can't be retained

= the *WQV Retention goal* is retained and/or treated somewhere else within the DOT R.O.W. and within the same subregional drainage basin

Pre- and post-construction DCIA must be tracked for each project affecting drainage

Image from the Washington DOT Highway Runoff Manual (Figure 5-44, Pg. 5-144).

Dated April 2014 with supplement February 2016.

Design Implementation

- Maximum Extent Practicable (MEP)
- Engineering Directive
 - Designer Worksheet
 - Instructions
 - Examples
 - BMP Matrix
 - BMP One-Pagers

Draft

CTDOT MS4 Project Design MEP Worksheet Instructions

The CTDOT MS4 Project Design MEP Worksheet is intended to be a living document that follows a project throughout its design. The primary intent of the Worksheet is to track the required metrics that must be reported to CT DEEP annually in order to comply with the DOT MS4 General Permit. It also serves as the required documentation to demonstrate that stormwater mitigation was pursued in a project's design to the maximum extent practical.

Section 1: Project Information

Indicate the Project, Number, Title and Location.

Section 2: Existing Conditions

Before the end of Preliminary Design, fill out the requested information available regarding a project site's existing conditions. As missing or updated information (e.g., soil infiltration potential, depth to groundwater, depth to bedrock) becomes available during later design phases, edit the Existing Conditions

E2. Pre-Construction DOT-Owned Directly Connected Impervious Area (DCIA) - Determine the amount of pre-construction DCIA. Here, DCIA is surface area within the project limits that a) is owned by DOT, b) is impervious, **and** c) drains to a wetland or watercourse either directly or via a storm sewer system discharge. Impervious cover includes pavement, sidewalks, roofs, exposed ledge, gravel roads/parking ($C \geq 0.7$).

Designer Insight - DCIA is also commonly known as effective impervious area.

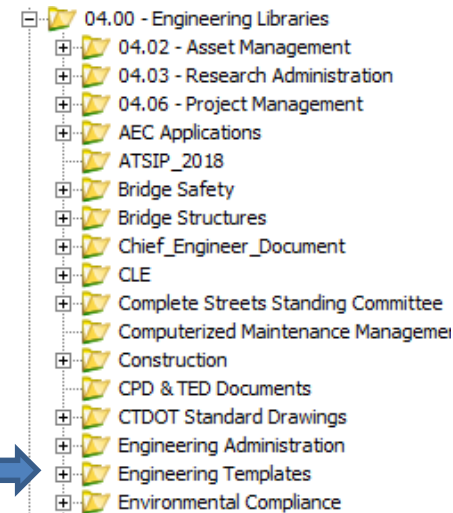

Determine the amount of Pre-Construction DOT-Owned DCIA as a percentage of the Total DOT-Owned Project Area. The %DCIA will typically remain consistent as the design progresses unless the total project area changes.

*Designer Insight - The primary purpose of %DCIA is to determine the Water Quality Volume and the **WQV retention design goal**, which will be the minimum goal for impervious area disconnections (see instructions for DC1, below.)*

DOT MS4 Project Design MEP Worksheet

- Worksheet Template found in 2 places
 - <https://www.ct.gov/dot/CTDOT-MS4>
 - Projectwise/4.00 Engineering Libraries/Engineering Templates
- Instructions are also available
- Save completed worksheets for each phase
 - Project Number / 310_Milestone_Submissions
- AEC's Digital Project Manual will be updated
- Comments on Draft Engineering Directive expected by April 10, 2019

DRAFT

Type of BMP	BMP	Pretreatment Practice	Runoff Reduction (First 1" of Runoff)	Pollutant Removal Efficiency	Approximate Footprint Size	Recommended Contributing Drainage Area (DA)	Typical Soil Types (NRCS: A, B, C, D)	Use in High Water Table	Use in Contaminated Soil or Groundwater	Use in Aquifer Protection Area	*Approximate Capital Cost (\$/ft ² Treated per Acre)	Annual Average O&M Cost	Comments
Simple Disconnection	Natural Dispersion Area		Varies	Low to Moderate	≥ DA Preferred	Limited to 75% of run-on from Imp. Areas (IA)	Any	X	X	X	N/A	Low	Concentrated flow requires use of level spreader prior to beginning of dispersion area
	Vegetative Filter Strip	X	Varies	Low to Moderate	DA or 25' Min. Width	Limited to 75% of run-on from Imp. Areas (IA)	Any	X	X	X	<\$5,000	Low	Soil amendments can be added to increase infiltration. Concentrated flow requires use of level spreader prior to beginning of dispersion area
Conveyance	Grass Channel	X	Low to Moderate	Low to Moderate	N/A	< 5 Acres	Any	X		X	<\$5,000	Low	Soil amendments can be added to increase infiltration.
	Water Quality Swale (Dry)		Low	Moderate to High	6 - 10% of DA	< 5 Acres	A, B		X		\$10,000 - \$60,000	Moderate	Can be installed with or without an underdrain depending on soils
	Water Quality Swale (Wet)		None	Moderate to High	6 - 10% of DA	< 5 Acres	C, D	X		X	\$10,000 - \$60,000	Moderate	
Infiltration or Filtration (w/underdrain)	Infiltration Trench		High	High	4-20% of DA	< 5 Acres	A, B, C*, D*				\$45,000	Moderate-High	Footprint size influenced heavily by infiltration rate. *Could add underdrain for locations with poor soils
	Infiltration Basin		High	High	4-10% of DA	< 25 Acres	A, B				\$23,000-\$90,000	Moderate-High	Footprint size influenced heavily by infiltration rate
	Dry Well / Leaching Catch Basin		High	Low	5-10% of DA	1 Acre or Less	A, B				\$35,000	Low-Moderate	Footprint size influenced heavily by infiltration rate & depth to groundwater
	Permeable Pavement		High	Low to Moderate	DA	N/A	A, B				\$20,000 - \$66,000	High	Pervious asphalt typically have lower capital cost than pervious concrete
	Bioretention		Varies	High	5-10% of DA	< 2 Acres	Any with Underdrain				\$56,000	Moderate-High	Can be installed with or without an underdrain depending on soils.
	Sand Filter w/underdrain		None	High	1-5% of DA	<10 Acres	Any with Underdrain		X		\$65,000	High	Sand filters should be considered when targeting removal of specific pollutants including nitrogen, phosphorus, sediment, metals and bacteria
Wet Ponds / Wetlands	Wet Pond		None	High	2-5% of DA	> 25 Acres	C, D	X		X	\$10,000 - \$25,000	Low - Moderate	A sediment forebay is required. Smaller contributing drainage areas are acceptable if groundwater flow.
	Constructed Shallow Wetland		None	High	5-10% of DA	> 10 Acres	C, D	X			\$11,000	Moderate	
	Subsurface Gravel Wetland		None	High	10-15% of DA	< 10 Acres	C, D	X			\$33,000	Moderate	
Proprietary / Structural BMPs	Hydrodynamic Separator	X	None	Low	5'-10' Diameter Manhole	Per Manufacturer	Any		X	X	\$10,000 - \$30,000	Low	
	Oil / Grit Separator	X	None	Low	Range from 3'x6' up to 8'x16'	Per Manufacturer	Any		X	X	\$10,000 - \$30,000	Low

Basins

- Sediment Basin
 - Temporary Construction BMP
- Detention Basin
 - Peak Flow Management
 - No Volume Reduction
 - Variations
 - Dry Basin, Extended Dry Basin
 - Wet Basin (“Treatment” BMP)
- Infiltration Basin (“Retention” BMP)
 - Must be constructed over permeable soils

BMP One-Pagers

Infiltration Basin

Description: A constructed impoundment that captures and infiltrates the design water quality volume over several days. Infiltration basins should be designed off-line to bypass larger flows and only manage the water quality volume.

BMP Information

BMP Type: Runoff Reduction
Targeted Pollutants: Bacteria, sediment, phosphorus, nitrogen, metals

Design Considerations

Drainage Area: 10 acres or less recommended
Sizing: Volume equal to water quality volume
Depth: 3' ideal, 6' maximum
Pretreatment: 25% of the water quality volume captured in sediment forebay
Soils: NRCS Hydrologic Soil Groups A and B
Infiltration Rate: Minimum of 0.30 in/hr
Drain Time: 12 hours min / 48 hours max

Limitations

- No aquifer protection areas
- No brownfield areas
- Seasonal high water table must be $\geq 3'$ below bottom

Maintenance Requirements

- Bi-annual inspections
- Mowing grass areas
- Remove trash and debris
- Clean sediment forebay

Cost Considerations:

Capital Cost: Moderate
O&M Cost: Moderate to High

Notes:

- Utilize half of the field measured infiltration rate for design purposes
- Do not use infiltration basins as temporary sediment traps during construction
- Basins may be equipped with an underdrain system for dewatering when the system becomes clogged

Infiltration Trench

Description: Shallow, excavated, stone-filled trenches in which groundwater is collected and infiltrated into the ground. Infiltration trenches can be constructed at a ground surface depression to intercept overland flow or can receive piped runoff

BMP Information

BMP Type: Runoff Reduction
Targeted Pollutants: Bacteria, sediment, phosphorus, nitrogen, metals

Design Considerations

Drainage Area: 5 acres or less; 2 acres recommended
Sizing: Volume equal to water quality volume
Trench Depth: 2 to 10 feet
Pretreatment: 25% of the water quality volume captured in sediment forebay or equivalent
Soils: NRCS Hydrologic Soil Groups A and B
Infiltration Rate: Minimum of 0.30 in/hr
Drain Time: 12 hours min / 48 hours max

Limitations

- No aquifer protection areas
- No brownfield areas
- Seasonal high water table must be $\geq 3'$ below bottom

Maintenance Requirements

- Bi-annual inspections
- Mowing grass areas
- Remove trash and debris
- Clean sediment forebay

Cost Considerations:

Capital Cost: Moderate
O&M Cost: Moderate to High

Notes:

- Utilize half of the field measured infiltration rate for design purposes
- Do not use infiltration basins as temporary sediment traps during construction
- Basins may be equipped with an underdrain system for dewatering when the system becomes clogged

Agenda

- CTDOT MS4 Team & MS4 Background
- DOT MS4 Permit Overview
- Design Implementation
- Impaired Waters & USGS Water Quality Model

Impaired Waters Monitoring

USGS will monitor 9 representative outfalls

- Locations were selected based on land use, impervious area, and traffic
- 2 years of continuous monitoring for each outfall

Parameters:

- precipitation
- snow depth
- air temperature
- water temperature
- flow
- conductance

CTDOT Photo of USGS building an outfall monitoring station in Glastonbury

Impaired Waters Monitoring

- In addition, each outfall sampled 15 to 18 times
 - 18 constituents listed in the DOT MS4 permit
 - 26 additional analytes
- Sampling results will be added to FHWA stormwater runoff database
- Monitoring and sampling results to be used in USGS's model for predicting roadway impacts to water quality

USGS Water Quality Model

S.E.L.D.M.

- Stochastic Empirical Loading Dilution Model
- Highway Runoff Quality Model

- Developed by USGS with the FHWA
- Utilized by other DOTs

- Washington
- Oregon
- Colorado
- Massachusetts

USGS Water Quality Model

SELDM: How will it be used?

- SELDM to be run on all mapped outfalls by the end of the permit term
 - Schedule tied to mapping
- Evaluate DOT's impact on a receiving waterbodies
- Model results will be used as basis for follow up investigations and implementation of BMPs
- Model will be used to develop Retrofit Program

Water Quality Model

Benefits of SELDM

- Aligns with overall DCIA reduction requirements
- Model will determine water quality impacts of project and potential BMPs to consider
- More of a desktop analysis than field activity
- Model to be run on mapped outfalls

Water Quality Model

FIRST PHASE

- First phase of modeling will identify watersheds where DOT operations have no impact
- Develop retrofit projects within proposed project limits

FUTURE

- Develop stand alone retrofit projects

Questions ?

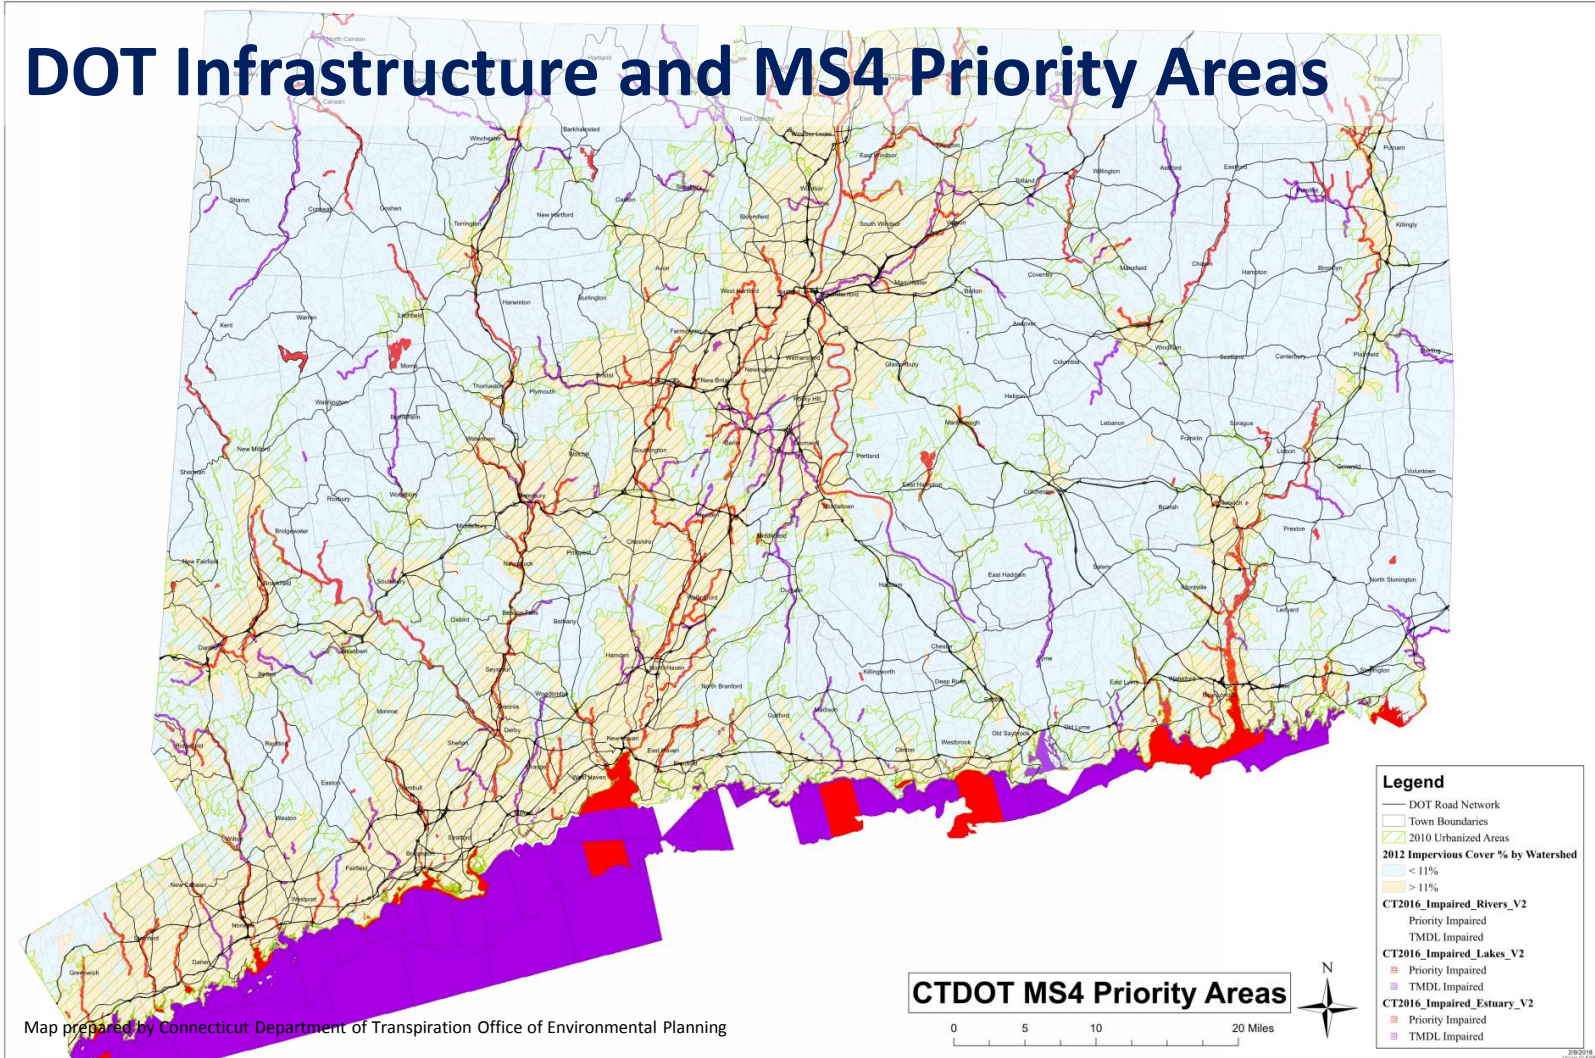

DOT.MS4@ct.gov

DOT Infrastructure-Priority

Areas

DOT Infrastructure and MS4 Priority Areas

DCIA DISCONNECTIONS

- Disconnections to be achieved through Stormwater BMPs on a project level

DISCONNECTED = the *WQV Retention*

Goal is retained

= the *WQV Retention goal* is treated if it can't be retained

= the *WQV Retention goal* is retained and/or treated somewhere else within the DOT R.O.W. and within the same subregional drainage basin

Pre- and post-construction DCIA must be tracked for each project affecting drainage
